Signal and Channel Parameters

```
% No.of Samples
N = 10000;

% SNR(in dBW)
SNR = [5,10,15,20,25,30];

% Channel Length for Rayleigh Fading
L = [2,3];

% Modulation Schemes
modulationTypes = categorical(["QPSK", "16-QAM", "64-QAM"]);

% Channels
channelTypes = categorical(["AWGN", "Rayleigh"]);

% Noarmalise Data
Norm = false;

% Ignoring Warnings
warning('off','all');
```

Data Generation

Generating Signal

```
numModulationTypes = length(modulationTypes);
numChannelTypes = length(channelTypes);
for i = 1:numChannelTypes
    for j = 1:numModulationTypes
        if channelTypes(i) == "Rayleigh"
            DataGeneration(N*50, modulationTypes(j), channelTypes(i), SNR, L, Norm)
        elseif channelTypes(i) == "AWGN"
            DataGeneration(N, modulationTypes(j), channelTypes(i), SNR, L, Norm)
        end
        fprintf('------\n');
    end
end
```

```
Saved Rayleigh 64-QAM Data
```

Functions

Bit Error Rate Calculation for a Signal

```
function DataGeneration(N, Modulation, Channel, SNR, L, Normalise)
    % Generating Transmitter Signal
    if Modulation == "OPSK"
        tx = randi([0 3], N, 1);
    elseif Modulation == "16-QAM"
        tx = randi([0 15], N, 1);
    elseif Modulation == "64-QAM"
        tx = randi([0 63], N, 1);
    end
    % Modulation: Modulating Data and Scatter Plotting it
    if Modulation == "OPSK"
        qpskmod = comm.QPSKModulator();
        txModulated = qpskmod(tx);
        %scatterplot(txModulated);
        %grid on;
    elseif Modulation == "16-QAM"
        txModulated = qammod(tx,16);
        %scatterplot(txModulated);
        %grid on;
    elseif Modulation == "64-QAM"
        txModulated = gammod(tx,64);
        %scatterplot(txModulated);
        %grid on;
    end
    % Normalising Data
    % This makes Power of Signal = 1
    if Normalise == true
        SignalEnergy = sqrt(mean(abs(txModulated).^2));
        txModulated = txModulated/SignalEnergy;
    end
